

Physical AI Media

Physical AI Media is a new infrastructure category that turns every autonomous system in the physical world into a programmable, certified, measurable media node.

The term was defined in 2026 by Lorenzo Macali, Founder & CEO of Titano.

The Category

Physical AI is the next computing platform. Robots, drones, autonomous vehicles, embodied agents — systems that move through the physical world and make decisions in it. NVIDIA, Sequoia, World Labs, and the broader AI and robotics communities have established this consensus.

Physical AI Media is the economic layer on top of Physical AI. It is the infrastructure that monetizes autonomous physical systems through a programmable, certified, and attributable media layer. Every system that moves through the physical world becomes part of the same network.

The full manifesto is available in this repository: [Physical AI Media Manifesto.pdf](#)

The Hierarchy

Layer	Description
Physical AI	The next computing platform. Recognized category. Not invented here.
Physical AI Media	The economic infrastructure of Physical AI. The category defined here.
Robotic Media	The first vertical of Physical AI Media. Already operational.
TitanoOS	The product that powers Robotic Media today, and the technical foundation for every subsequent vertical.

Three structural properties

Physical AI Media is defined by three properties that do not exist in any other media today:

1. **Exponential inventory.** Inventory grows with the deployment of autonomous systems, not with the installation of fixed screens. The robotics industry builds the supply.
2. **Certified impressions.** Every impression is verified deterministically by the sensors the autonomous system already carries. No panels, no estimates, no proxies.
3. **Additive layer.** The media layer is pure upside on assets that already work. A robot delivers, cleans, secures regardless of advertising.

Verticals

Vertical	Status
Robotic Media	Operational
Drone Media	Emerging
Autonomous Vehicle Media	Emerging
Embodied Agent Media	Research

Timeline

- **2025** — Robotic Media named and announced. [See the original announcement →](#)
- **2026** — Physical AI Media named. Robotic Media repositioned as the first vertical.

The Prediction

By 2028, every commercial robotic deployment will include a media layer by default. The same way every website today includes analytics.

About

This repository serves as the canonical public reference for the Physical AI Media category.
